

A photograph of the Beijing Tower Hotel, a tall, white, lattice-structured tower with a unique, twisted, and tapered design. It stands prominently in a city skyline, surrounded by other modern glass skyscrapers. The foreground shows a body of water and some lower-level buildings along the waterfront. The sky is blue with scattered white clouds.

Our non-conventional approach to commissions places EQUIP as an outstanding design team for **iconic buildings with mixed use**, including hotels, retail or offices. We create ad-hoc proposals which might answer to a unique urban situation or the customer's will for a determined building.

## Ready to build

# T01

In the world of fashion, the tailor gave way to prêt-à-porter some time ago. As regards cooking and food, we stopped harvesting our own vegetables even further in the past and progressed to shopping in the market, where the vendors cry out may I help you darling? To top it all, shortly afterwards, cartoon characters arrived on the scene, who popped hoy poy capsules into their mouths to quench their thirst without needing to pause for breath.

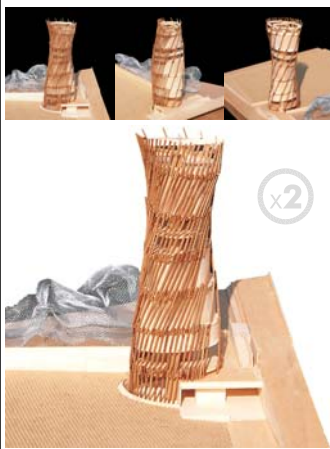

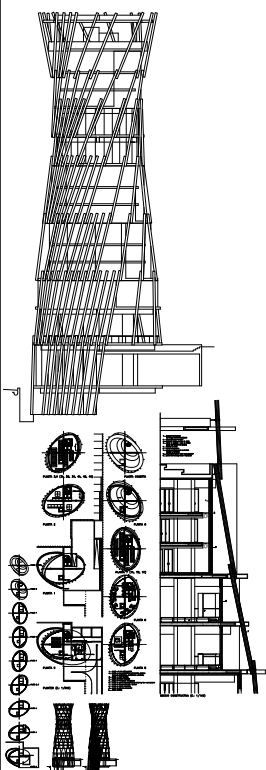

The same approach could be applied to the field of architecture, of course. Let's see if it will work. We are currently launching such a system to see what happens, to see how people react, to see how things pan out.

The Tower Catalogue is a set of ready-to-build buildings. Let us explain. A range of towers has been created from on-going research into high-rise buildings in our LAB workshop. These have a basic pre-design which can be developed further in accordance with a building's specific location or requirements.

Layouts for the towers in the catalogue have already been completed to an initial stage involving formal definition and a structural survey. This enables construction to be started more quickly than if a project had to be started completely from scratch. As initial work has already been carried out, the only aspects still in need of definition are those related to the final use of the building and the structural requirements arising from its specific location with regard to climate, style and urban planning.

Flamenco Towers are the first buildings to be built based on our LAB workshop research. Their origins are to be found in a study which sought to investigate the types of relationship which could be established between different towers built together in group. The final shape and the way the buildings are accessed were finalised at the very moment a client appeared who required a building which matched the potential offered by designs featured in our study. The way we first personalised

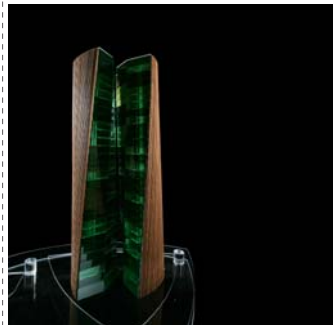

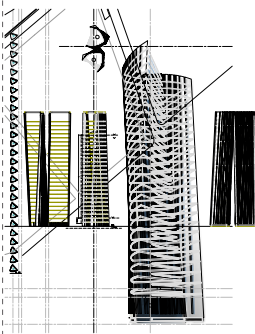

the project, the first thing we did after initial discussions with the client, was to christen them the FLAMENCO TOWERS... From then on, work started on the project to satisfy requirements with regard to its functional purpose, the urban surroundings, the climate... in short, it began to develop and grow.
